

## Hashing:

- A technique that determines an index or location for storage of an item/element in a data structure

(0-6)

(size of Array)

Hash table - data structure that store elements & allows operations (insertion, search, delete)

Operation on Hash table -

1. Insertion

hash value  $\rightarrow$  index  $\rightarrow$  insert

2. Deletion

key index  $\rightarrow$  delete

3. Search

hash value  $\rightarrow$  index  $\rightarrow$  found

Insert  $\rightarrow$   $h(k)$   $\rightarrow$  directly the position

of that element

$$O(1)$$

Delete  $\rightarrow h(k) \rightarrow$  directly we can delete  
the position of  
delete

$$O(1)$$

Search  $\rightarrow h(k) \rightarrow$  directly element  
will be found

$$O(1)$$

$$h(x) = \text{key} \% 10$$

Division Method %

$$23 \% 10 = 3$$

2	12
3	13 / 23
...	
9	

$$12 \% 10 = 2$$

$$13 \% 10 = 3$$

Hash Table

1 Key  $\longrightarrow$  1 Index

Mapping

1 key  $\longrightarrow$  1 Index  
one to one mapping

Multiple keys  $\longrightarrow$  1 Index

Many  $\longrightarrow$  one Mapping

Example

key values.

$$h(x) = x \bmod 10$$

13, 3  
14, 4

Many to one Mapping

Multiple key  $\longrightarrow$  Same index

Collision

Important

Solution — ? (To handle collision)

## Collision Resolution Methods —

1. Open Hashing (Separate-chained hash table)  
— chaining (linked list)

2. Closed Hashing (Open address hash tables)  
— Linear Probing (1D Array)  
— Quadratic Probing (next index identify)

Open Addressed Hash table —

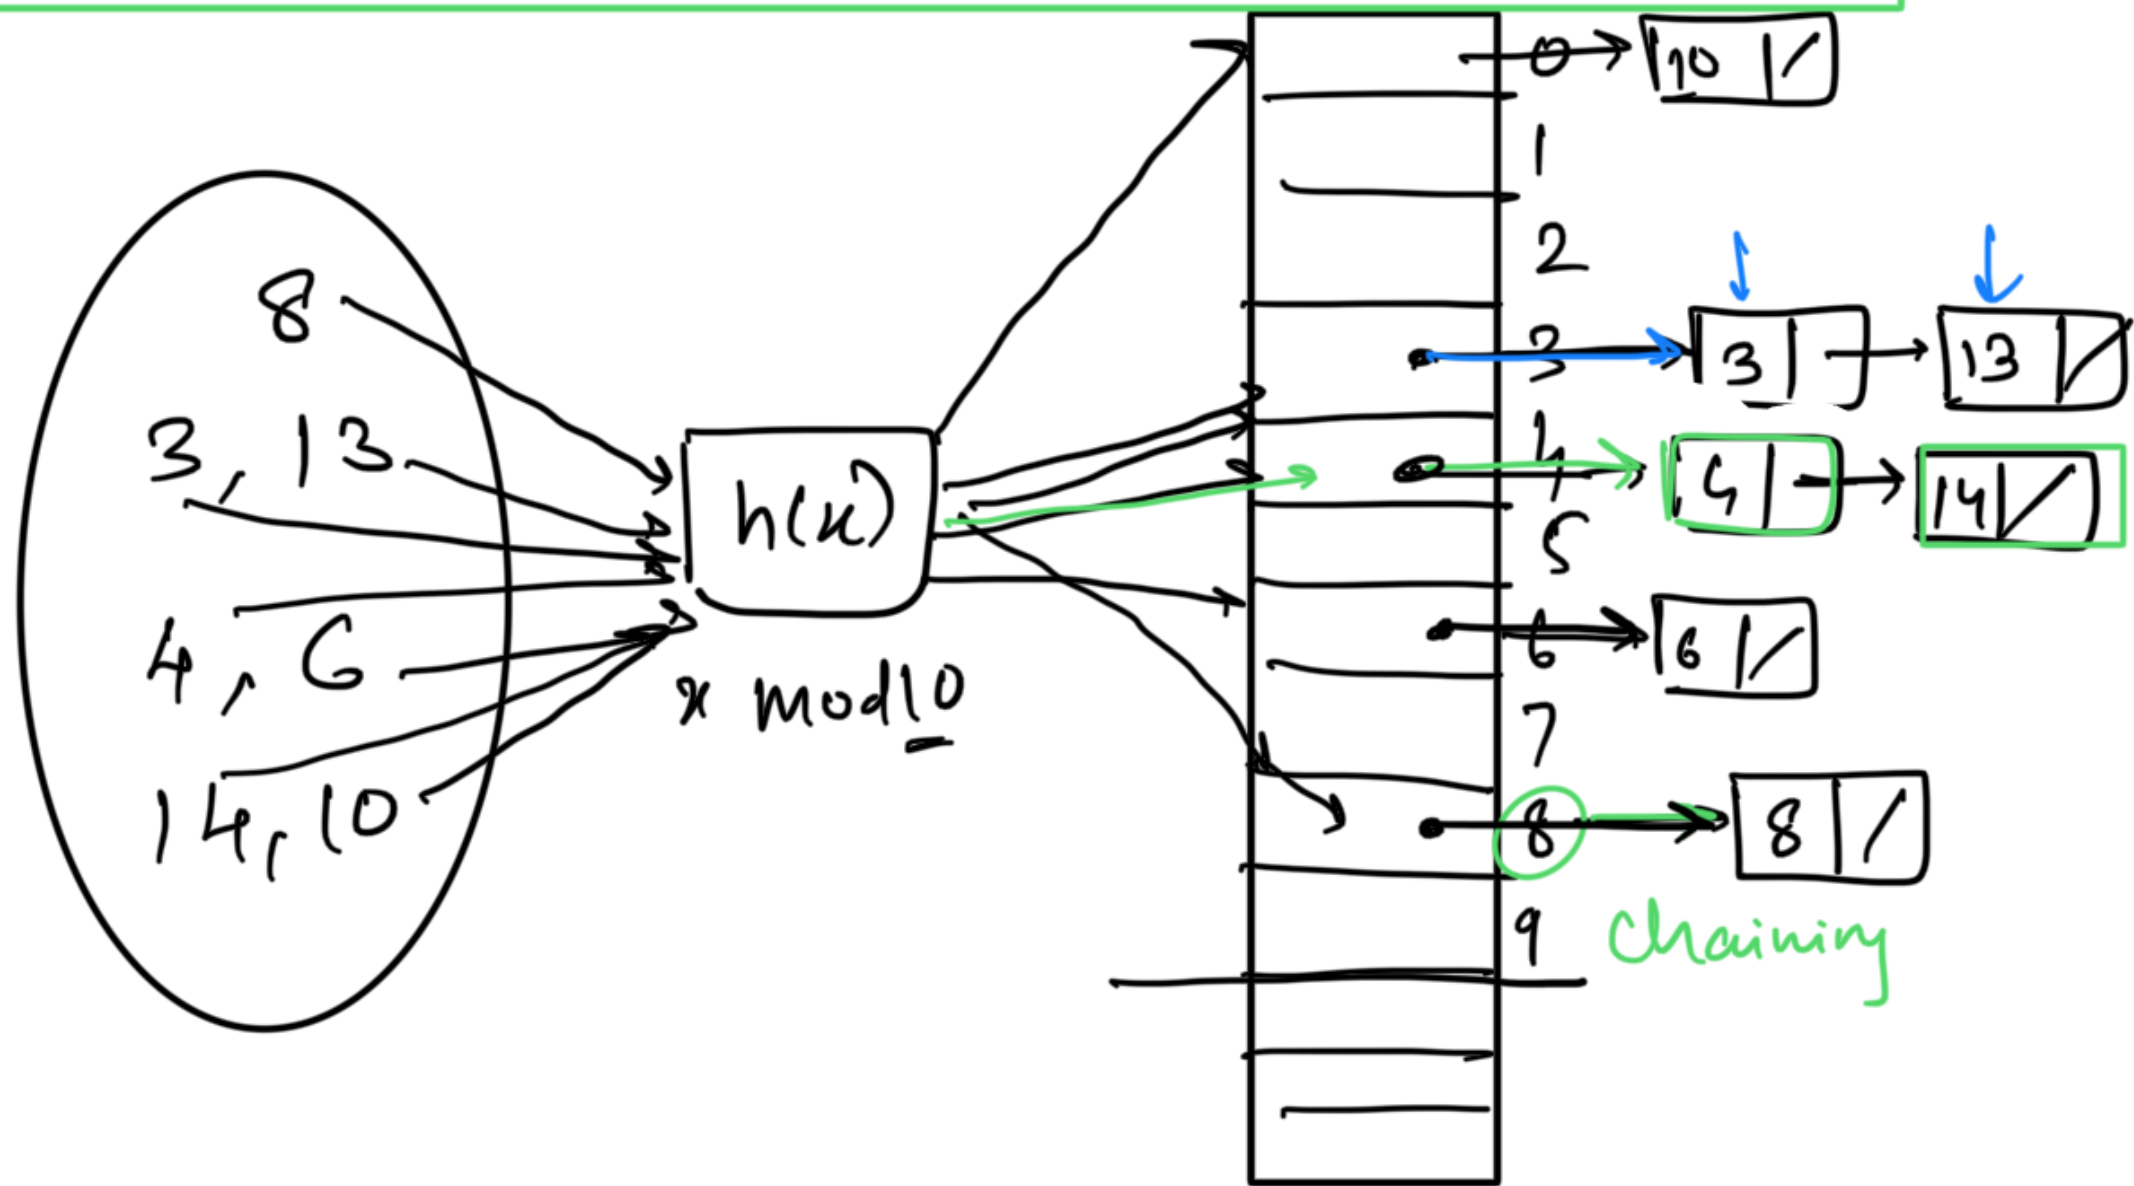

One-dimensional array indexed by integer values  
that are computed by an index function  
called as hash function

Separate Chained Hash Table (open hashing)

One dimensional array of linked list  
indexed by integer values that are  
computed by an index function called a  
hash function

## Example → Open Hashing (Chaining)

key → index → ?

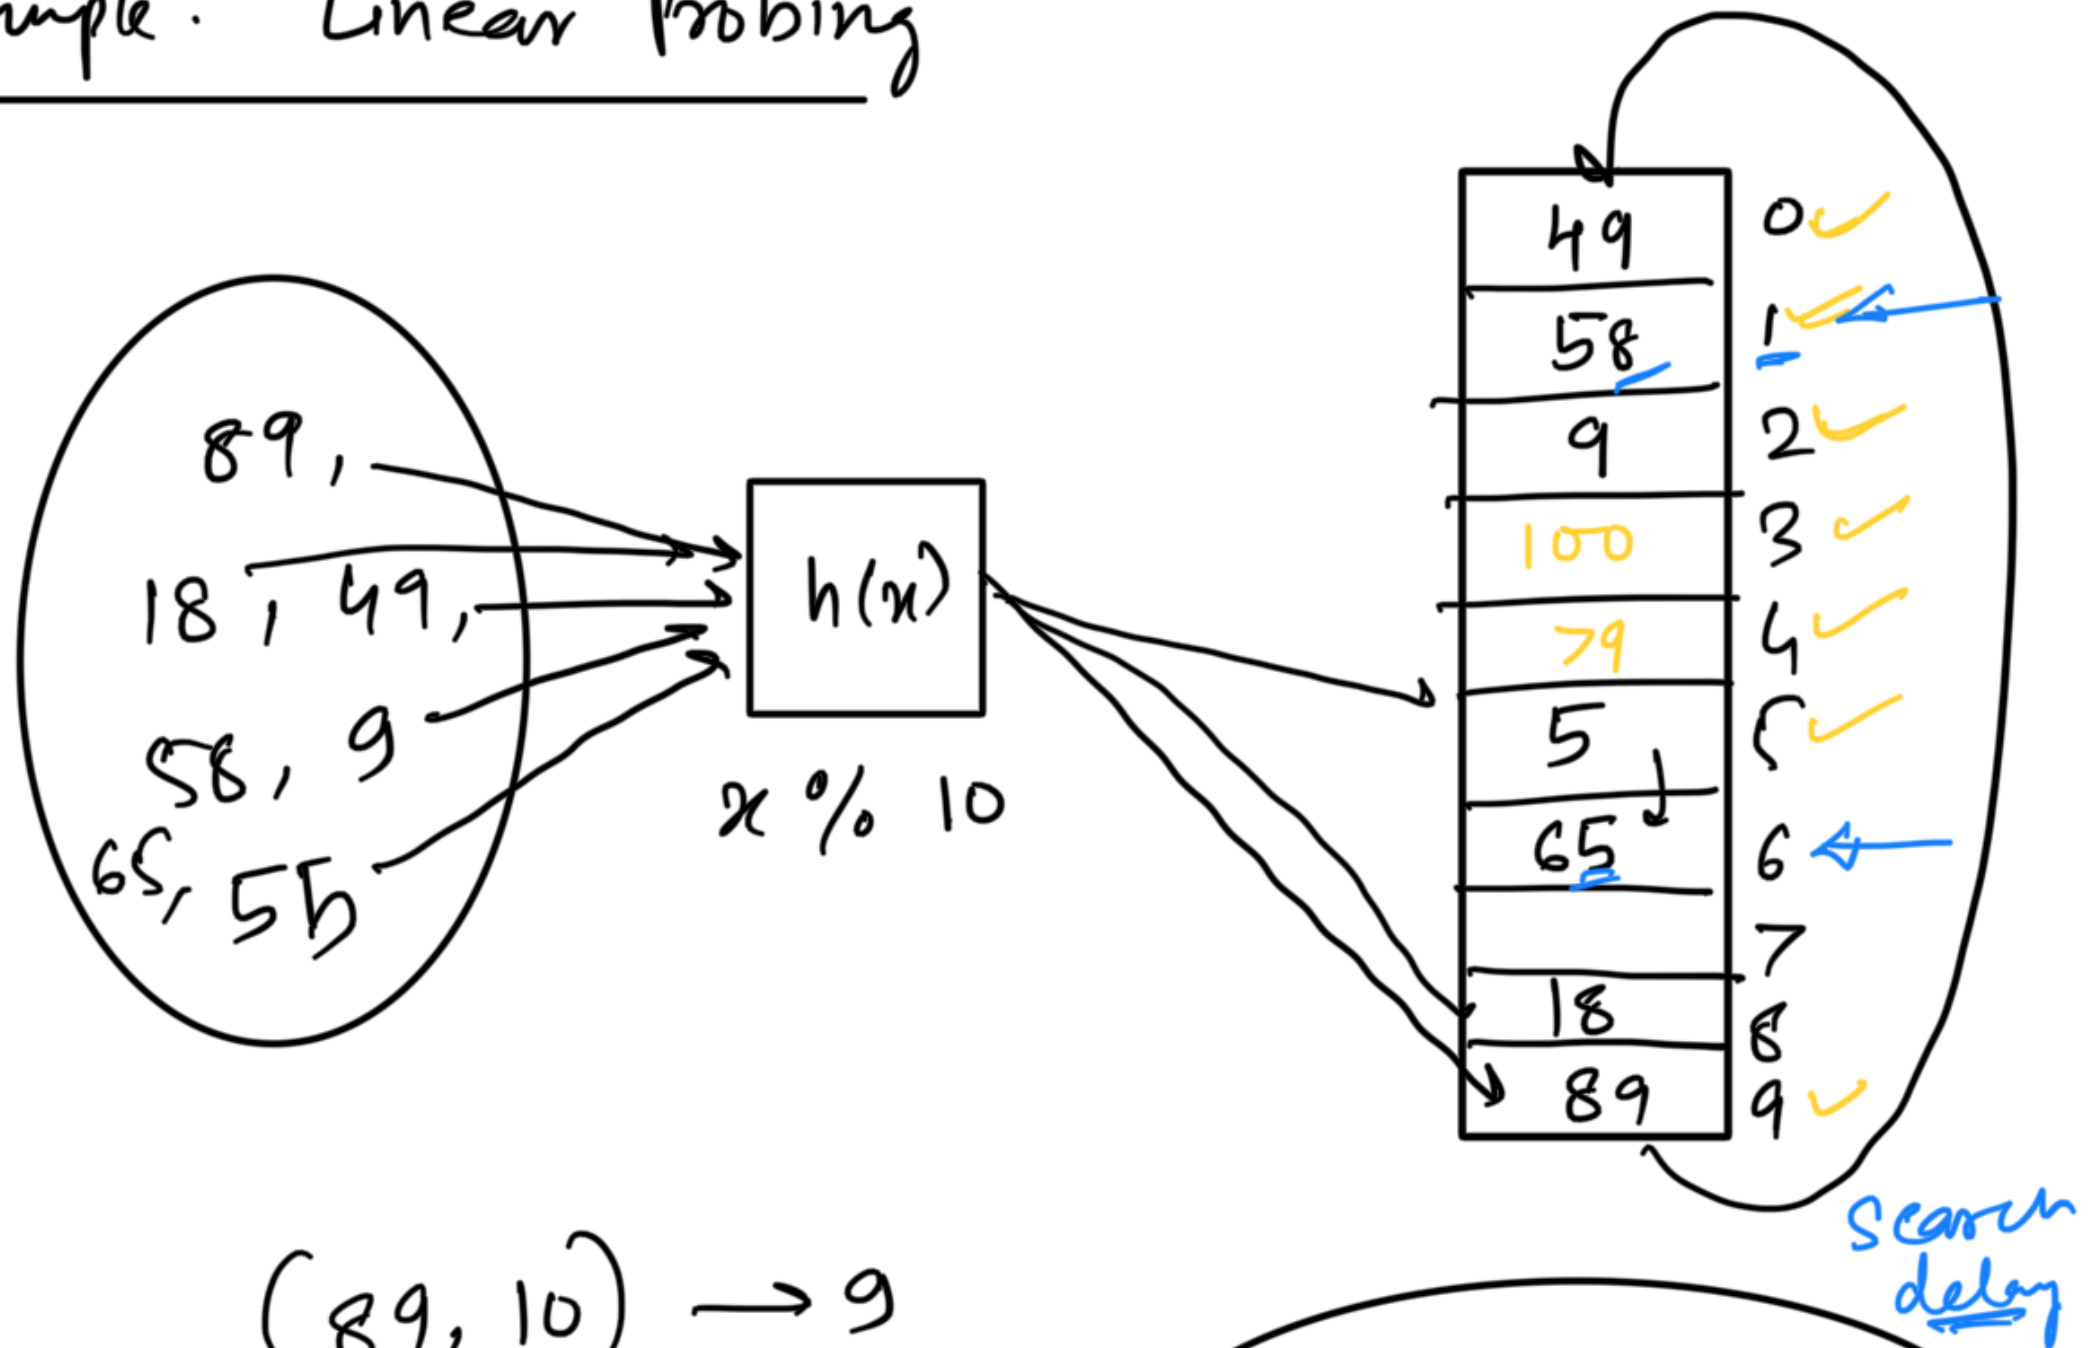

HW → keys = 0, 1, 4, 9, 16, 25, 36, 49, 64, 81

Represents the keys in hash table using separate

Chaining with bucket size 11.

Example: Linear probing

$$(89, 10) \rightarrow 9$$

$$(18, 10) \rightarrow 8$$

$$(49, 10) \rightarrow 9$$

Linear probing

$$\begin{aligned}
 (58, 10) &\rightarrow 8 \checkmark \\
 (9, 10) &\rightarrow 9 \\
 (14, 10) &\rightarrow 4 \rightarrow
 \end{aligned}$$

Disadvantage  $\rightarrow$  linear probing  
 Deletion  $\rightarrow O(n)$

Q Quadratic probing -

$$h(x) = x \bmod i^2$$

$$x \bmod 1^2 = 3 \times$$

$$x \bmod 2^2 = 4 \rightarrow \text{insert}$$

Example

Table = i = 11

Hash function =  $h(x) = x \bmod 11$

Key  $\Rightarrow$  20, 30, 2, 13, 25, 24, 10, 9

$$20 \bmod 11 = 9$$

$$30 \bmod 11 = 8$$

$$2 \bmod 11 = 2$$

Collision  $\rightarrow 13 \bmod 11 = 2 \rightarrow 2 + 1^2 = 3$

$$25 \bmod 11 = 3 \rightarrow 3 + 1^2 = 4$$

$$\rightarrow 10 \bmod 11 = 10$$

$$\rightarrow 9 \bmod 11 = 9 \rightarrow 9 + 1^2 = 10$$
$$9 + 2^2 = 13$$

LP  $\Rightarrow +1, 1, 2, 1, 2$

$$(a + i^2) \bmod 11 =$$

	0
	1
2	2
13	3
25	4
	5
	6
9	7
30	8
20	9
10	10

$$Q \Rightarrow +1^4 / +2 / +3$$

$$( \dots )$$

$$13 \bmod 11 = 2$$

$$(9 + 3^2) = 18$$

$$18 \bmod 11 = 7$$

Time Complexity

	Best / Average	Worst
Insert $\longrightarrow$	$O(1)$	$O(n)$
Delete $\longrightarrow$	$O(1)$	$O(n)$
Search $\longrightarrow$	$O(1)$	$O(n)$

Space Complexity

Hash Table  $\rightarrow$  Array  $[n] \rightarrow$

Average }  $O(n)$   
Worst }
